

OUR TS EN 61400 POLICY

MILRES A.S. aims to meet the great need in the wind turbine market in the field of self-consumption with domestic technology. With its unique design and technology, it enables the production of Turkish wind energy turbines that are competitive at world standards. MilRes protects its national character and the efforts of its stakeholders under the brand name, and establishes its name in the international market. It directs the commercial and technical know-how of the founders of the company, based on years of experience, to the same purpose and carries it to the future in an institutionalized form.

Our aim is to produce a real, tangible and national solution to energy consumption, which is one of the most difficult and urgent problems of the world. During production, safety, design, structure, usability and quality control of workmanship are ensured and the process is evaluated and certified by the certifying company. Our company and our turbines are entitled to be the first certified turbine in Turkey and this will be ensured with precision in every turbine.

As we strive to achieve this goal, we aim to maximize the safety of our wind turbines, including design, installation, maintenance and operation.

Within the framework of the procedures and rules required for the conformity testing and certification of wind turbines, we commit that we will successfully carry the turbine production we have realized in line with the **“Product and Production Responsibility”** TS EN 61400 standards, that it will be continuously developed and ergonomic, that we will carry out the implementation of the standard with precision in the production of quality turbines by advancing TS EN 61400 within national and international laws.

By saying **“Quality First”**, our goal of reliable and high quality turbines is the basis of all our work by performing strength, structure analysis, machine components, electrical equipment, turbine tests and periodic monitoring after turbine installation.

“Proper material selection” means that only materials with guaranteed properties are used in the force and moment transmitting components of our wind turbines and that only materials with tested and approved specific environmental and operating conditions are taken into account. All materials will be treated according to the relevant Standards in terms of quality requirements and test conditions.

“Production and tests” tests and controls of parameters such as welding, chemical storage, laminate structure, curing, sealing, gluing, bonding, joining, mold request, wing joining during construction will be provided in line with the standards.

We will fully comply with the laws and contemporary demands in the fields of **“Environmental Protection and Occupational Safety.”** We will create **“EFFECTIVE BUSINESS RESULTS”** together with all our employees and suppliers by following the principles of **“EFFICIENCY AND SAVINGS”** that prevent waste of time, cost and resources, and by improving our infrastructure and work environment.
